🎓 👤 Education Background

Southern University of Science and Technology (SUSTech) · Bachelor of Science in Computer Science and Technology (Expected) August 2024 – June 2028

GPA: 3.73/4.0, University Scholarship Recipient. Core Courses: Artificial Intelligence, Algorithm Analysis and Design, Data Structures and Algorithm Analysis, Engineering Probability and Statistics, Calculus, Linear Algebra

High School Affiliated to Southwest University, Liangjiang New Area, Chongqing · Physics, Chemistry, Biology Track August 2021 – June 2024

Gaokao Score: 670, Ranked 715th among 203,000 test-takers in Chongqing.

🎓 ⚙️ IT Skills

- Programming Languages: Python (Proficient), Java (Proficient), SQL (Familiar);
- Development Tools: Git, VS Code, Linux/Windows Environments;
- Finance Basics: Basic understanding of stocks/funds/bonds and financial time series concepts;
- Other: English (Proficient, TOEFL 100).

🎓 🧪 Research Direction

Factor Mining · Supervised by Prof. Peng Yang September 2025 – Present

Focused on the application of reinforcement learning algorithms in factor mining, researching stock trend prediction models;

- Used Python scripts to crawl historical stock market data, completed data cleaning and statistical indicator calculation;
- QFR can stably generate formulaic Alpha factors with high predictability, low turnover, strong volatility resistance, and full interpretability under different market environments and index targets;
- Developed investment strategies using factors mined by the QFR algorithm, achieving an annual cumulative return of 18.873% in CSI 300.

🎓 📁 Internship/Project Experience

Reversi AI (Monte Carlo Tree Search) October 2025 – December 2025

Personal Project (Designed AI for Reversi game matches) · Python

- Implemented Monte Carlo Tree Search (MCTS) same as AlphaGo, combined with heuristic evaluation function to optimize decision-making;
- Improved search efficiency through pruning strategies, overcoming the slow search efficiency problem of traditional AI, and can make decisions within a reasonable time;
- No pre-training required, can play directly, with a 98% win rate against random AI.

Income Prediction AI Model (GBDT+ANN) December 2025 – January 2026

Personal Project (Designed AI to predict income based on occupation, marital status, etc.) · Python

- Innovatively integrated Gradient Boosting Decision Tree (GBDT) and Artificial Neural Network (ANN) to bin features, improving ANN learning efficiency;
- Tested on public datasets, prediction accuracy improved by 10% compared to traditional ANN;
- Used early stopping strategy to accelerate model training and avoid overfitting, model training time is only about 1 minute, balancing performance and efficiency.
